NON-STATIONARY SYNCHRONY AND ASYNCHRONY IN A DEEP-SEA POPULATION

Climate, fishing and population-dependent drivers

Manuel Hidalgo, Lucia Rueda, Juan Carlos
 Molinero, Beatriz Guijarro and Enric Massutí

NON-STATIONARY **SYNCHRONY** AND ASYNCHRONY IN A DEEP-SEA POPULATION

Mechanisms leading to intra-
 specific synchrony:

- 1. Exogenous environmental conditions** (i.e. Moran effect).
- 2. Dispersal and connectivity** processes among populations or population subunits.
- 3. Trophic interactions** with populations of other species.
