# Supplementary Material: High-Sensitive TRBC1-Based Flow Cytometric Assessment of T-Cell Clonality in T $\alpha \beta$-Large Granular Lymphocytic Leukemia 

Noemí Muñoz-García, F. Javier Morán-Plata, Neus Villamor, Margarida Lima ${ }^{\mp}$, Susana Barrena, Sheila Mateos, Carolina Caldas, Jacques J.M. van Dongen, Alberto Orfao and Julia Almeida

Protocol S1. Combining sample aliquots stained with a CD45 antibody conjugated to 8 different fluorochromes into only two antibody combinations ready to be measured in the flow cytometer.

1. Prepare 1 to 8 tubes with $100 \mu \mathrm{~L}$ of peripheral blood
2. Add the appropriate volume of each TCRV $\beta$, CD45, and TRBC1 antibodies per tube (as described in Supplementary Table 1, Panel II) in combination with $50 \mu \mathrm{~L} /$ tube of Brilliant Stain Buffer (Becton/Dickinson Biosciences (BD), San Jose, CA)
3. Mix well, preferably by gently vortexing
4. Incubate for 30 min at room temperature (RT) protected from light
5. Add 2 mL of washing buffer to the cell pellet
6. Mix well, preferably by gently vortexing
7. Centrifuge for 5 min at 540 g
8. Discard the supernatant using a Pasteur pipette or vacuum system without disturbing the cell pellet, leaving approximately $50 \mu \mathrm{~L}$ residual volume in each tube
9. Mix well, preferably by gently vortexing
10. Combine cells from tubes 1-4 and from tubes 5-8 into two single tubes, respectively; for this purpose, wash the 8 tubes from the first set of tubes with washing buffer to recover all cells that might have been left in the original tubes.
11. Centrifuge for 5 min at 540 g
12. Discard the supernatant using a Pasteur pipette or vacuum system without disturbing the cell pellet, leaving approximately $50 \mu \mathrm{~L}$ residual volume in each tube
13. Mix well, preferably by gently vortexing
14. Add the appropriate volume of the remaining antibodies to the two tubes
15. Mix well, preferably by gently vortexing
16. Incubate for 20 min at RT protected from light
17. Add 2 mL of 1X FACS Lysing Solution - 10X FACS Lysing Solution (BD) diluted $1 / 10 \mathrm{vol} / \mathrm{vol}$ in distilled water, following the recommendations of the manufacturer-
18. Mix well, preferably by gently vortexing
19. Incubate for 15 min at RT protected from light
20. Centrifuge for 5 min at 540 g
21. Discard the supernatant using a Pasteur pipette or vacuum system without disturbing the cell pellet, leaving approximately $50 \mu \mathrm{~L}$ residual volume in each tube
22. Mix well, preferably by gently vortexing
23. Add 2 mL of washing buffer to the cell pellet
24. Mix well, preferably by gently vortexing
25. Centrifuge for 5 min at 540 g
26. Discard the supernatant using a Pasteur pipette or vacuum system without disturbing the cell pellet, leaving approximately $50 \mu \mathrm{~L}$ residual volume in each tube
27. Mix well, preferably by gently vortexing
28. Resuspend the cell pellet in $200 \mu \mathrm{~L}$ of acquisition buffer

29．Acquire the cells（preferably）immediately after staining or store at $4^{\circ} \mathrm{C}$ for a maximum of 1 hour until measured in the flow cytometer

Table S1．Panels of fluorochrome－conjugated antibody reagents used in this study．
