**Chemistry procedures**

Melting points were obtained on a Reichert-Jung Kofler apparatus and are uncorrected. The elemental analysis was performed with a Heraeus CHN-O-RAPID instrument. The elemental compositions of the compounds agreed to within ±0.4% of the calculated values. For all the tested compounds, satisfactory elemental analysis was obtained supporting >95% purity. Electrospray mass spectra were measured on a quadrupole mass spectrometer equipped with an electrospray source (Hewlett-Packard, LC/MS HP 1100). $^1$H and $^{13}$C NMR spectra were recorded on a Varian INNOVA 300 operating at 299 MHz ($^1$H) and 75 MHz ($^{13}$C), respectively, a Varian INNOVA-400 operating at 399 MHz ($^1$H) and 99 MHz ($^{13}$C), respectively, and a VARIAN SYSTEM-500 operating a 499 MHz ($^1$H) and 125 MHz ($^{13}$C), respectively.

Analytical TLC was performed on silica gel 60 F$_{254}$ (Merck) precoated plates (0.2 mm). Spots were detected under UV light (254 nm) and/or charring with ninhydrin or phophomolibdic acid. Separations on silica gel were performed by preparative centrifugal circular thin-layer chromatography (CCTLC) on a Chromatotron$^8$ (Kiesegel 60 PF$_{254}$ gipshaltig (Merck)), with layer thickness of 1 and 2 mm and flow rate of 4 or 8 mL/min, respectively. Flash column chromatography was performed in a Biotage Horizon instrument.

Microwave reactions were performed using the Biotage Initiator 2.0 single-mode cavity instrument from Biotage (Uppsala). Experiments were carried out in sealed microwave process vials utilizing the standard absorbance level (400 W maximum power). The temperature was measured with an IR sensor on the outside of the reaction vessel.
