## Chemistry procedures

Melting points were obtained on a Reichert-Jung Kofler apparatus and are uncorrected. The elemental analysis was performed with a Heraeus CHN-O-RAPID instrument. The elemental compositions of the compounds agreed to within $\pm 0.4 \%$ of the calculated values. For all the tested compounds, satisfactory elemental analysis was obtained supporting $>95 \%$ purity. Electrospray mass spectra were measured on a quadrupole mass spectrometer equipped with an electrospray source (Hewlett-Packard, LC/MS HP 1100 ). ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Varian INNOVA 300 operating at $299 \mathrm{MHz}\left({ }^{1} \mathrm{H}\right)$ and $75 \mathrm{MHz}\left({ }^{13} \mathrm{C}\right)$, respectively, a Varian INNOVA-400 operating at $399 \mathrm{MHZ}\left({ }^{1} \mathrm{H}\right)$ and $99 \mathrm{MHz}\left({ }^{13} \mathrm{C}\right)$, respectively, and a VARIAN SYSTEM-500 operating a $499 \mathrm{MHz}\left({ }^{1} \mathrm{H}\right)$ and $125 \mathrm{MHz}\left({ }^{13} \mathrm{C}\right)$, respectively.

Analytical TLC was performed on silica gel $60 \mathrm{~F}_{254}$ (Merck) precoated plates ( 0.2 mm ). Spots were detected under UV light ( 254 nm ) and/or charring with ninhydrin or phophomolibdic acid. Separations on silica gel were performed by preparative centrifugal circular thin-layer chromatography (CCTLC) on a Chromatotron ${ }^{\mathrm{R}}$ (Kiesegel $60 \mathrm{PF}_{254}$ gipshaltig (Merck)), with layer thickness of 1 and 2 mm and flow rate of 4 or $8 \mathrm{~mL} / \mathrm{min}$, respectively. Flash column chromatography was performed in a Biotage Horizon instrument.

Microwave reactions were performed using the Biotage Initiator 2.0 single-mode cavity instrument from Biotage (Uppsala). Experiments were carried out in sealed microwave process vials utilizing the standard absorbance level ( 400 W maximum power). The temperature was measured with an IR sensor on the outside of the reaction vessel.
