EIP Water  
 ESA SMOS (Soil Moisture and Ocean Salinity) Mission

RESEWAM-O is a well defined Innovation Opportunity service, par excellence, envisaging the provision of a versatile methodology –in principle applicable in all sensitive areas in the world- that integrates the knowledge, diagnostic and monitoring capacity of remote sensing with optimum engineering solutions and efficient financial tools.

For the first time, the problem (water scarcity) and the solution (water resources connections, treatment plants, preserving freshwater supplies for urban uses that will be connected through a feasibility plan) are approached together within the same vision.

RESEWAM-O puts together administration, agricultural farmers/cooperatives and companies suppliers of water services to develop services and products helping various economic sectors adapting to climate change, especially focusing on energy and water utilities
