

Fig. S1. Fecundity of the broodstock and viability of the zebrafish eggs used in this study. A) Number of eggs spawned by the seven pair of breeders used in this study. The dashed line indicates the reference value for zebrafish (Ribas and Piferrer, 2014). B) Egg survival during 0–6 days post fertilization. The dashed line indicates the minimum accepted value in the OECD’s Fish Sexual Development Test (OECD, 2011). In the boxplots, the solid and dashed lines indicate the median and mean, respectively; the lower and upper edges indicate the 25th and 75th percentiles, respectively; and the top and the bottom whiskers indicate the 5th and 95th percentiles, respectively.
