One of our research interests is related with the synthesis of water soluble thionate complexes of platinum(II) and palladium(II) with antitumoral properties, using PTA (1,3,5-triaza-7-phosphadamantane) and DAPTA (3,7-diacetyl-1,3,7-triaza-5-phosphabicyclo-[3.3.1] nonane) as neutral ligands^{1,2}. Also, we are interested in the properties of advanced film-shaped organic polymer biomaterials. Given the growing interest in the application of biomaterials bearing biologically active principles, both interests have been merged in the design and preparation of inorganic-organic hybrid film-shaped materials containing both chemically anchored and dispersed metal complexes with antitumor properties against a variety of human cancer cell lines. Both complexes and films interact with the Bovine Serum Albumin (BSA) protein³.
