

Supplement of

Observations of iodine monoxide over three summers at the Indian Antarctic bases of Bharati and Maitri

5

6 **Table S1:** Mean and standard deviations for the mixing ratios and the vertical columns of IO
7 observed during the four campaigns.

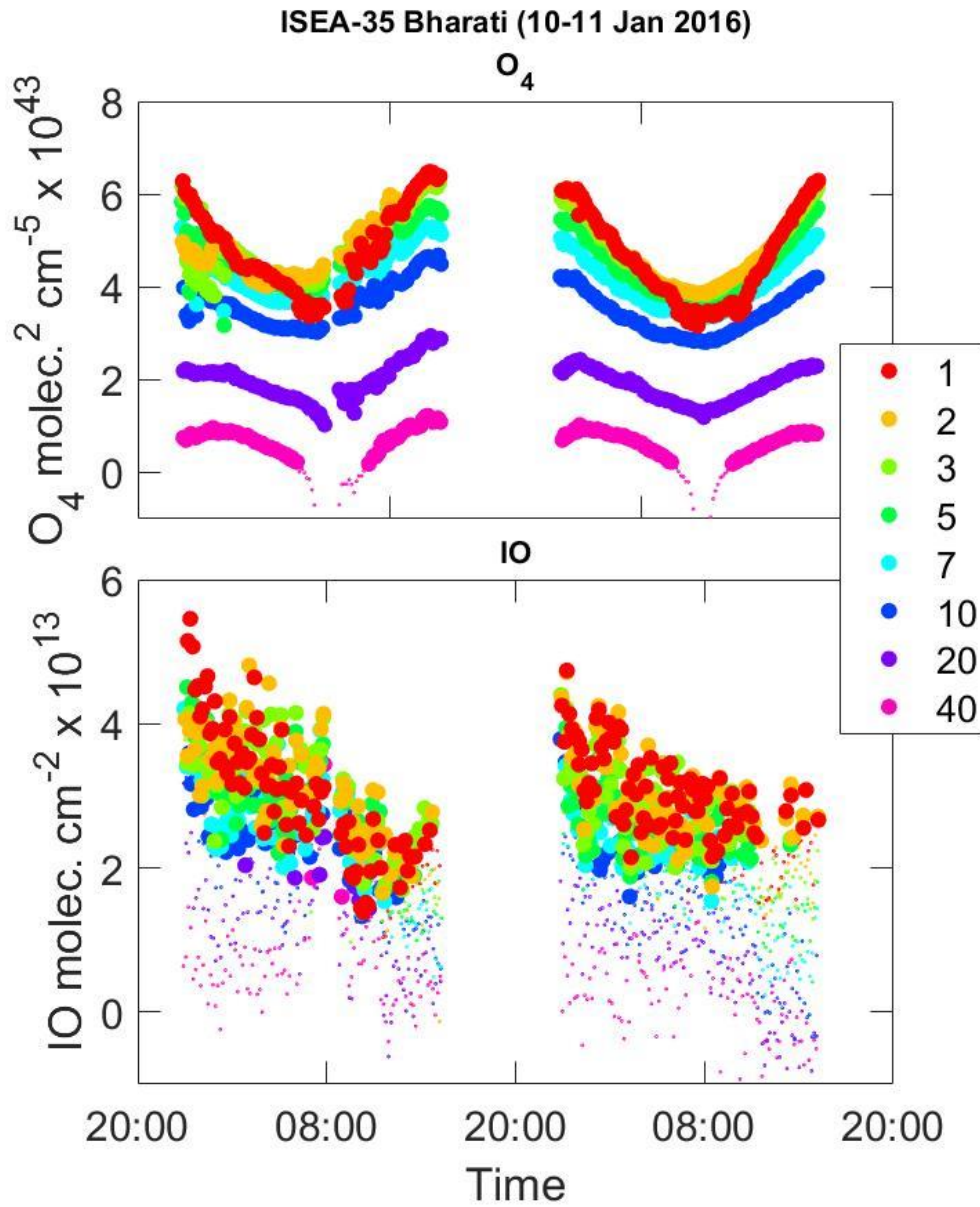

Campaign	Mean \pm Std. Dev. IO mixing ratio below 400 m (pptv)	Mean \pm Std. Dev. IO Vertical Column Density (VCD) ($\times 10^{12}$ molecules cm^{-2})
ISEA-34 Bharati	0.30 \pm 0.05	2.83 \pm 0.60
ISEA-34 Maitri	0.41 \pm 0.29	3.40 \pm 0.57
ISEA-35 Bharati	0.36 \pm 0.27	2.62 \pm 1.16
ISEA-36 Bharati	0.47 \pm 0.31	3.92 \pm 0.79

8

9

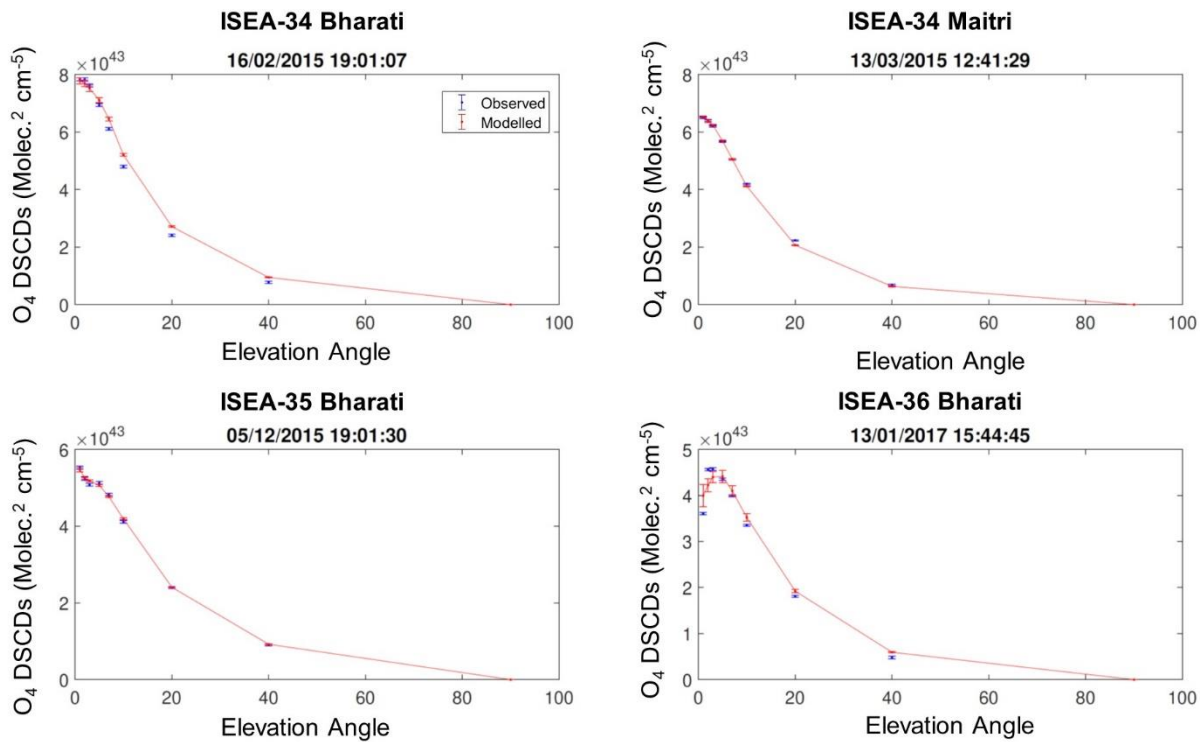

10 **Figure S1:** Typical examples of DOAS fits for O₄ and IO are shown. Both the fits are from 1st
 11 February 2016, during ISEA-35 at Bharati at 05:33:56 UTC, solar zenith angle: 54.15° and
 12 elevation angle: 3°. The RMS for the O₄ window was 4.44×10^{-4} (2σ detection limit: 0.19×10^{43}
 13 molecule² cm⁻⁵) and the retrieved DSCD was $4.40 \pm 0.03 \times 10^{43}$ molecule² cm⁻⁵. The RMS for the
 14 IO window was 3.7×10^{-4} (2σ detection limit: 2.11×10^{13} molecules cm⁻²) and the retrieved DSCD
 15 was $4.1 \pm 0.5 \times 10^{13}$ molecules cm⁻².

16

17 **Figure S2:** A zoomed in view of two typical days, which were mostly clear, for the O_4 and IO
 18 DSCDs observed during the 35th ISEA at Bharati are shown. The smaller circles represent values
 19 below the 2σ detection limit of the instrument, while the bigger circles are values above the 2σ
 20 detection limit. The data are color-coded according to elevation angles. The times are in UTC.

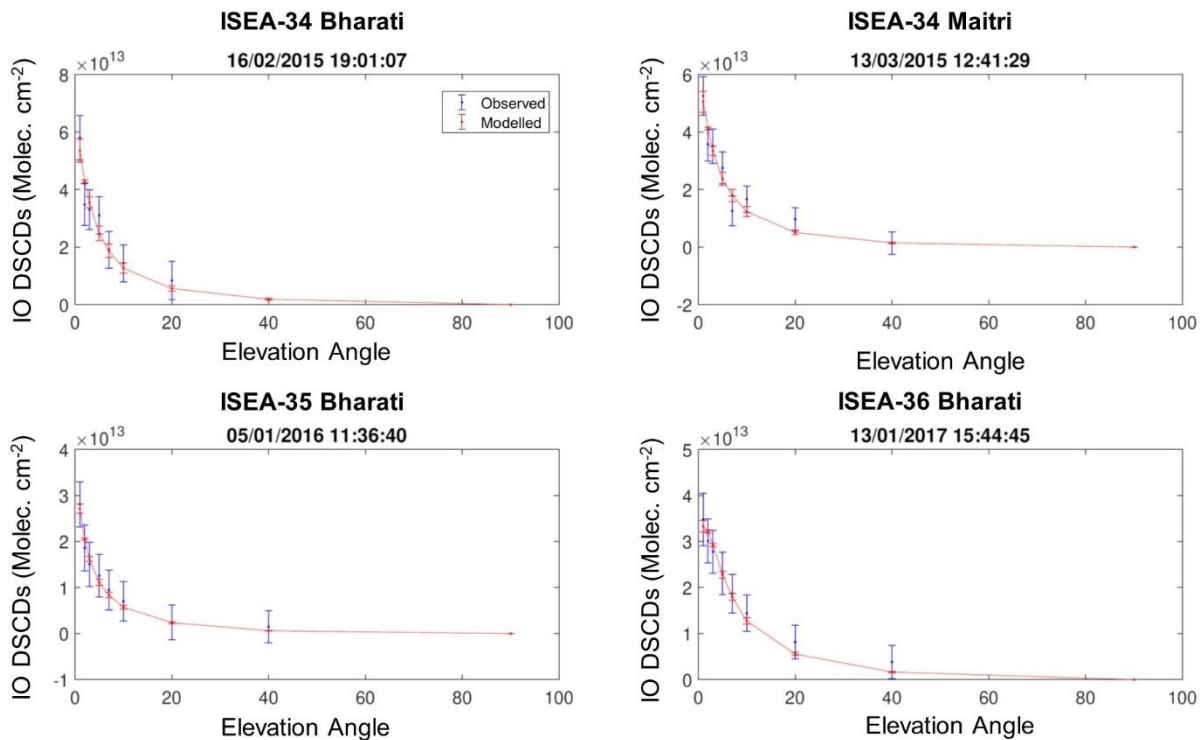

21

22

23 **Figure S3:** A comparison of the MAX-DOAS observed O₄ DSCDs with the MAPA modelled
 24 DSCDs for all the four campaigns are shown. These are typical examples chosen randomly for the
 25 scans which were retrieved as ‘good’.

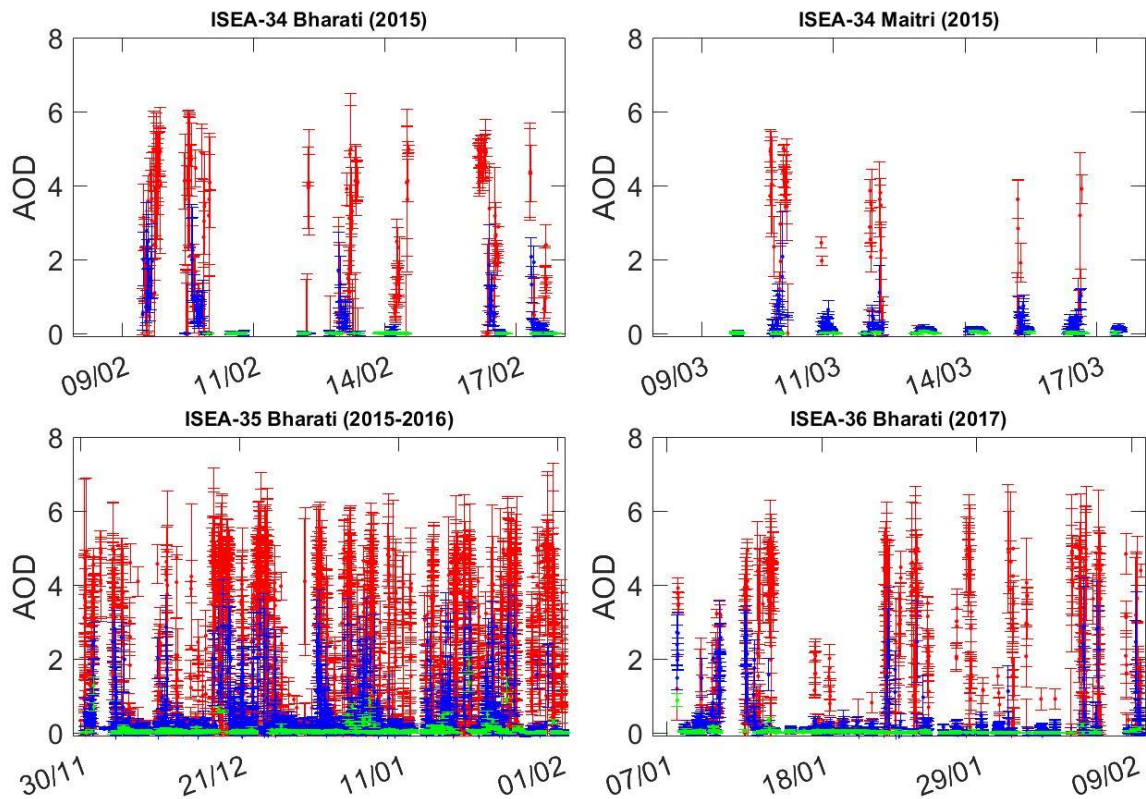

26

27

28 **Figure S4:** A comparison of the MAX-DOAS observed IO DSCDs with the MAPA modelled
 29 DSCDs for all the four campaigns are shown. These are typical examples chosen randomly for the
 30 scans which were scanned as ‘good’.

31

32

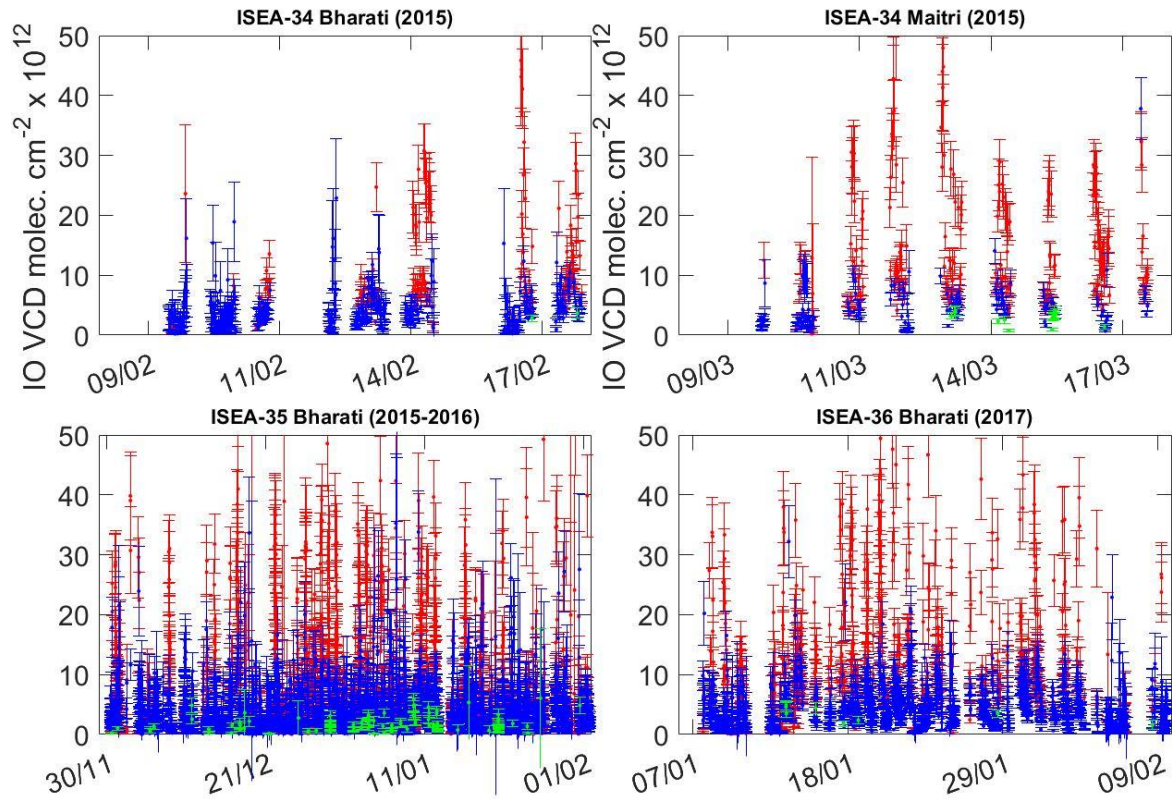

33 **Figure S5:** AOD timeseries retrieved using the O₄ DSCDs for all the four campaigns are shown.

34 The flags for ‘good’ (green), ‘warning’ (blue) and ‘bad’ (red) are colour coded. The green data

35 show the good datapoints, which are reliable and were mostly during clear sky conditions. The

36 times are in UTC.

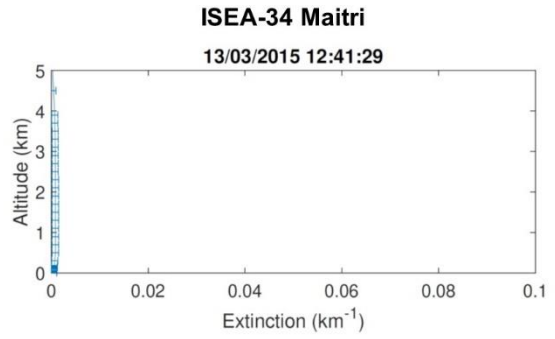

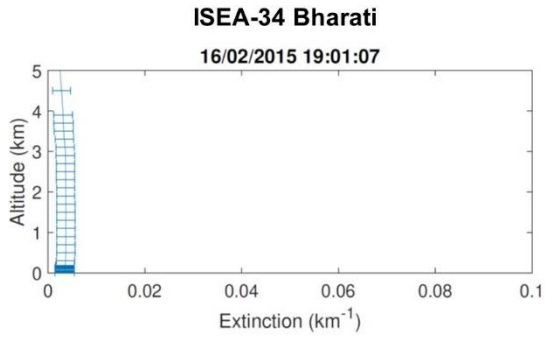

37

38

39 **Figure S6:** Observations of IO vertical column densities observed through all the four
 40 campaigns are shown. The flags for ‘good’ (green), ‘warning’ (blue) and ‘bad’ (red) are colour
 41 coded. These data were mostly during periods of clear sky, and where IO was observed above
 42 the detection limit for most of the set elevation angles, enabling a reliable profile retrieval. The
 43 times are in UTC.

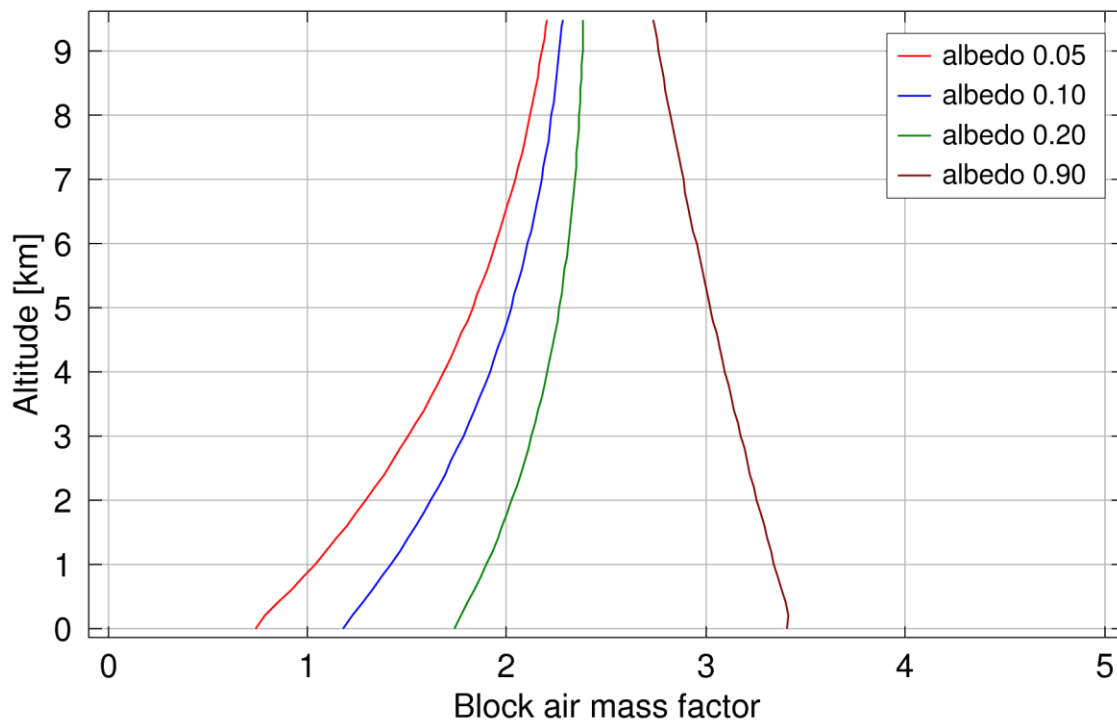

44

45

46 **Figure S7:** Typical examples of aerosol extinction profiles retrieved during all the four campaigns
47 are shown.

48

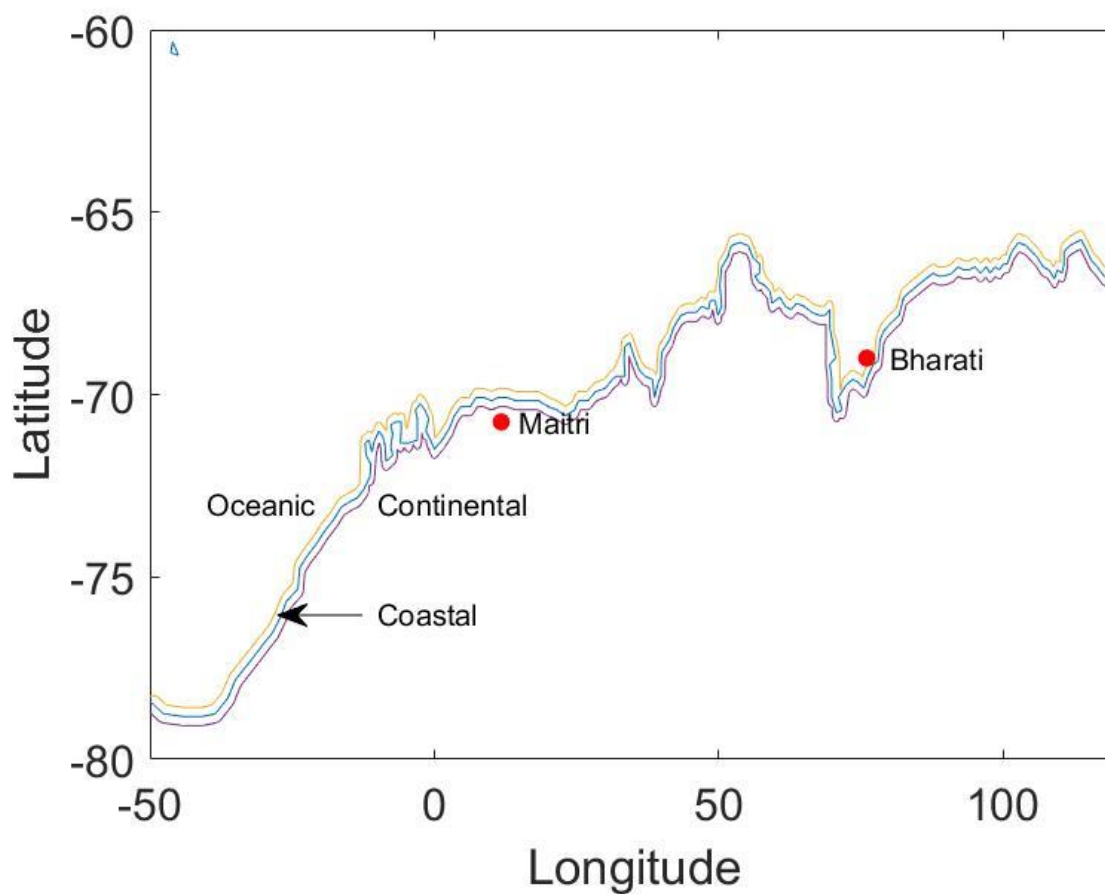

49

50 **Figure S8:** The block air mass factors for satellite retrievals showing the significant difference
51 between the block AMFs over Antarctica at different albedo values are shown.

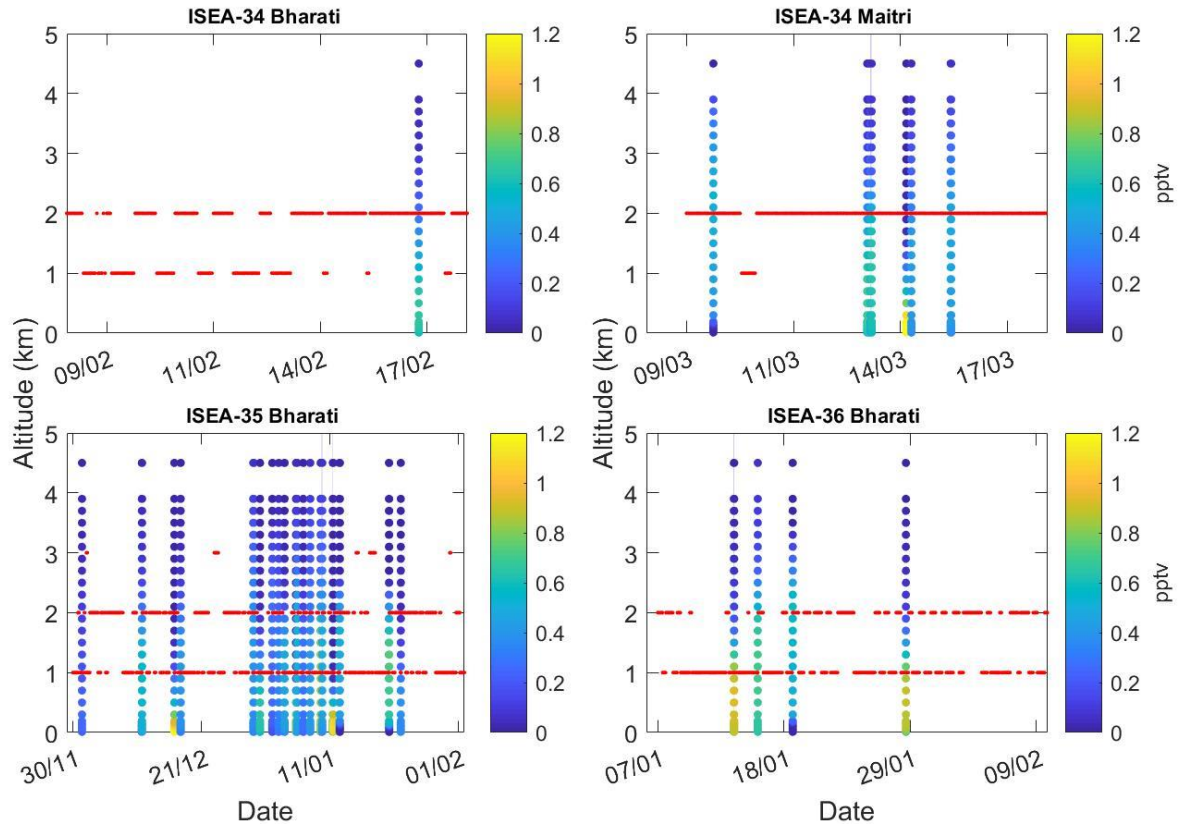

52

53

54

55 **Figure S9:** Source regions defined for studying the back trajectories. A 0.5° belt along the
 56 Antarctic coast (blue line) was selected as ‘coastal’, with the oceanic (yellow boundary) and
 57 continental (purple boundary) defined any regions to the north and south of this belt.

58

59 **Figure S10:** Vertical profiles of IO (coloured scatter plot) along with the source regions (red
 60 points) during all the campaigns are shown. The source regions were 1= Coastal; 2= Continental
 61 and 3= Oceanic, as defined in the text. The times are in UTC.
