Age and growth analysis of squid (Loliginidae) paralarvae in the NW Spanish coast using statoliths increment counts

Elsa García-Mayoral, Álvaro Roura, Graham J. Pierce, Ángel F. González

**Fig. SI 1** Smoother for the effect of age (NI) on dorsal mantle length (DML) in *A. media*, *A. subulata* and *L. vulgaris*. Dashed lines indicate 95% confidence intervals around the main effect and the solid line represents the estimated smoother. The vertical lines at the bottom (the “rugplot”) indicate the values of NI and the vertical axis represent the contribution of NI to the fitted values of DML.
