Age and growth analysis of squid (Loliginidae) paralarvae in the NW Spanish coast using statolith increment counts

Elsa García-Mayoral, Álvaro Roura, Graham J. Pierce, Ángel F. González

Fig. SL 2 Smoothing curves obtained by additive model using the A. media, A. subulata and L. vulgaris data, showing the effect of age on statolith length. The solid line is the estimated smoother and the dashed lines indicate 95% confidence intervals around the main effect. The vertical lines at the bottom indicate the values of NI and the vertical axis represent the contribution of NI to the fitted values of SL.
